Sorting: A brief introduction

Why Sorting?

The base algorithms upon which many other algorithms are built

Mathematically tractable (for the most part)..

Many sort algorithms --- which sort?
- Analyze trade-offs and reason about algorithms
- Appreciate the fundamentals of algorithmic analysis

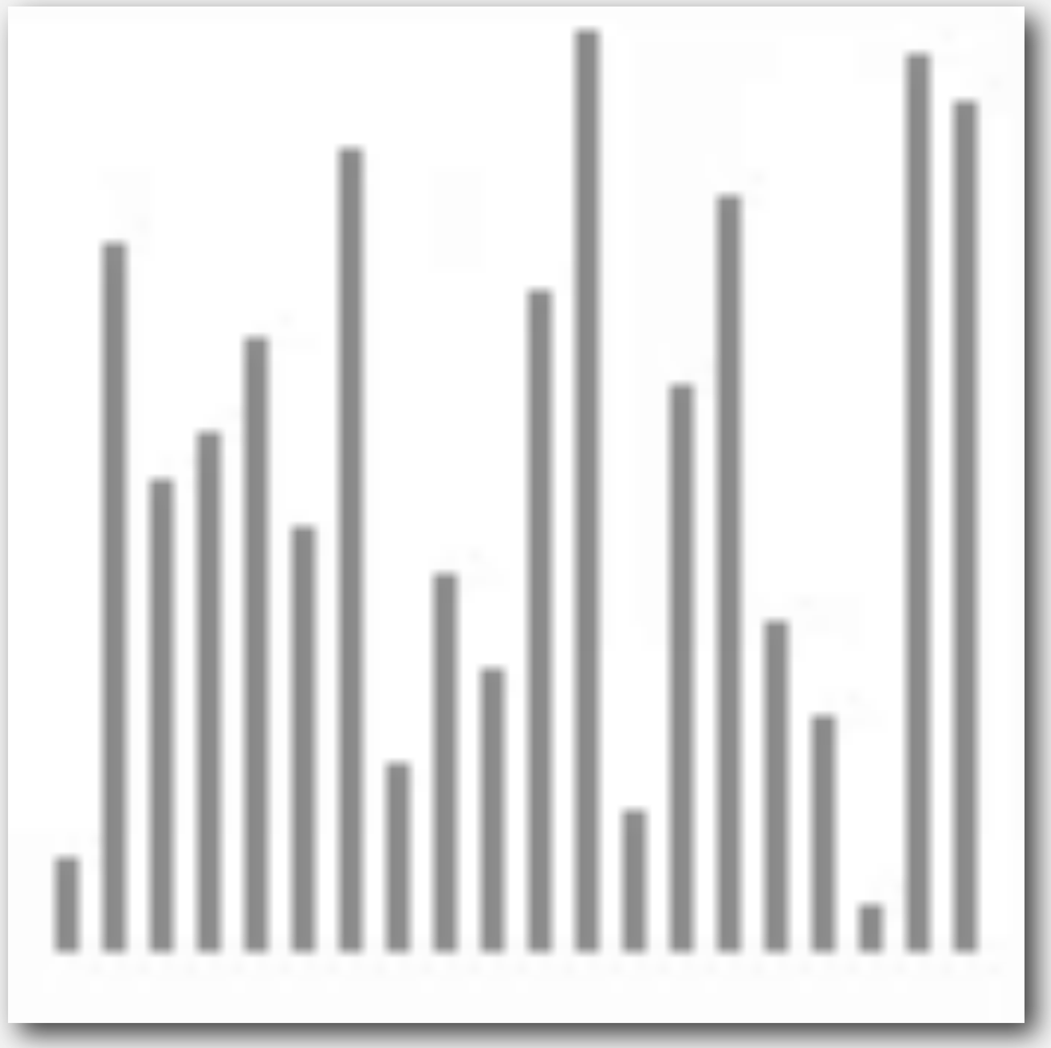
Elementary Sort:

Simple is better than many of the more sophisticated Algo!

Used by more sophisticated (sort and non-sorting) Algorithms

Selection sort: animations

20 random items



▲ algorithm position

▬ in final order

▬ not in final order

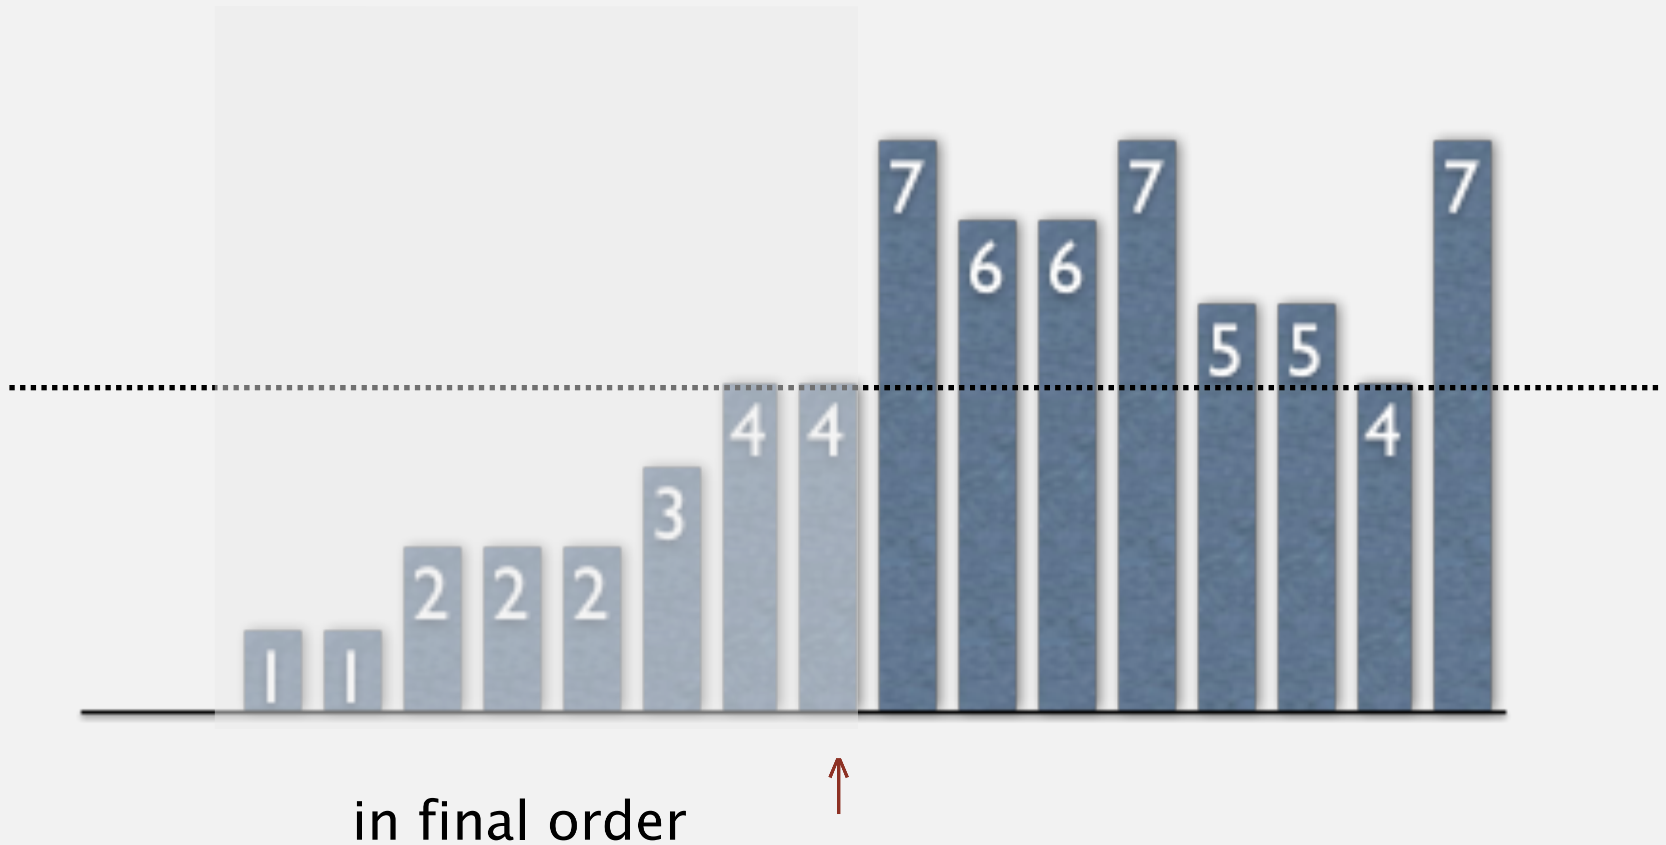
http://www.sorting-algorithms.com/selection-sort

Selection sort

Algorithm. ↑ scans from left to right.

Invariants.

- Entries the left of ↑ (including ↑) fixed and in ascending order.
- No entry to right of ↑ is smaller than any entry to the left of ↑.

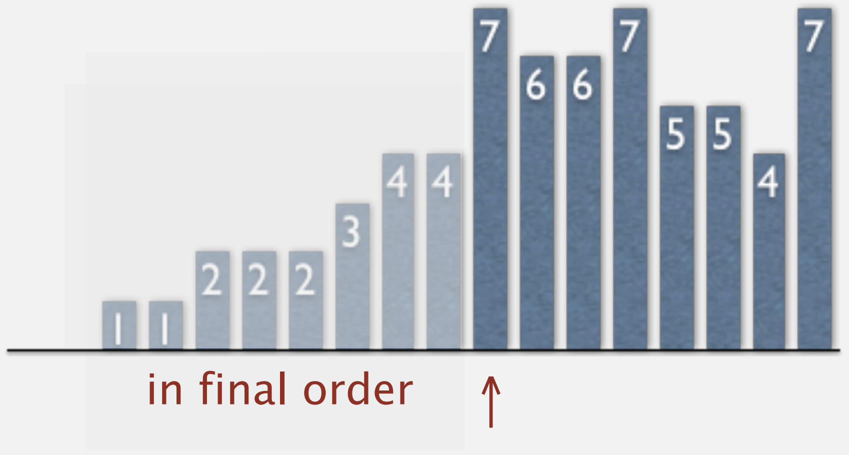


Selection sort inner loop

To maintain algorithm invariants:

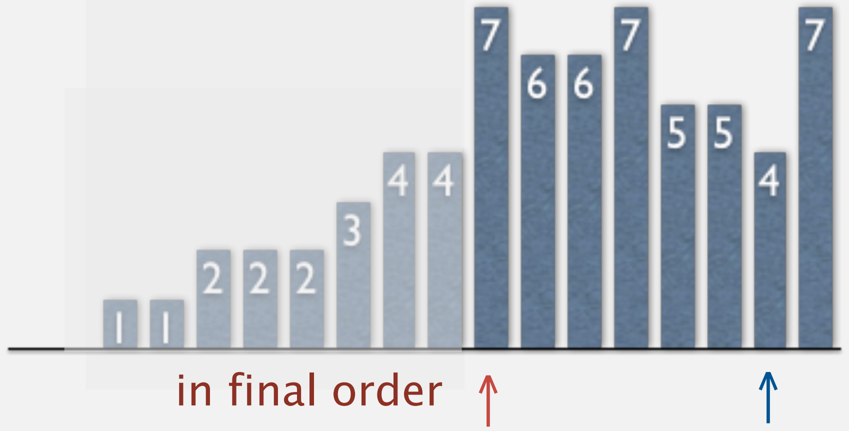
- Move the pointer to the right.

```
i++;
```



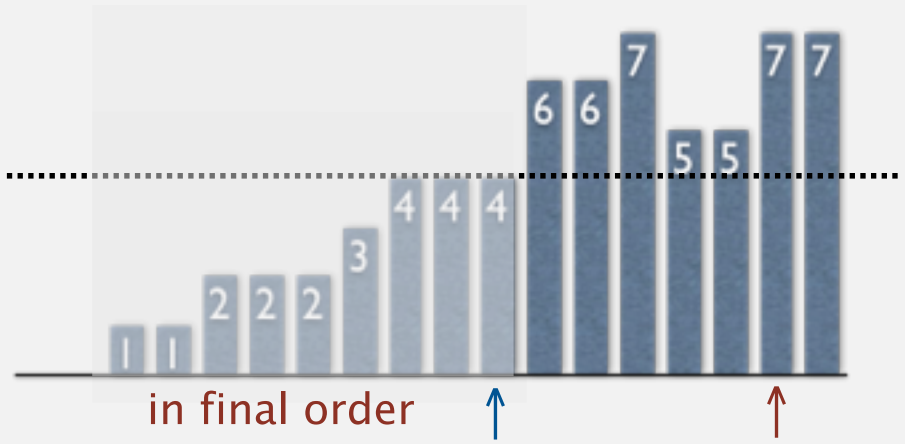
- Identify index of minimum entry on right.

```
int min = i;
for (int j = i+1; j < N; j++)
   if (less(a[j], a[min]))
      min = j;
```



- Exchange into position.

```
exch(a, i, min);
```



Selection sort demo

Selection sort: mathematical analysis

Proposition. Selection sort uses $(N-1) + (N-2) + \ldots + 1 + 0 \sim N^2/2$ compares and N exchanges.

		a[]										
i	min	0	1	2	3	4	5	6	7	8	9	10

		A	E	E	L	M	O	P	R	S	T	X

entries in black are examined to find the minimum

entries in red are a[min]

entries in gray are in final position

Trace of selection sort (array contents just after each exchange)

Running time insensitive to input. Quadratic time, even if input array is sorted.

Data movement is minimal. Linear number of exchanges.

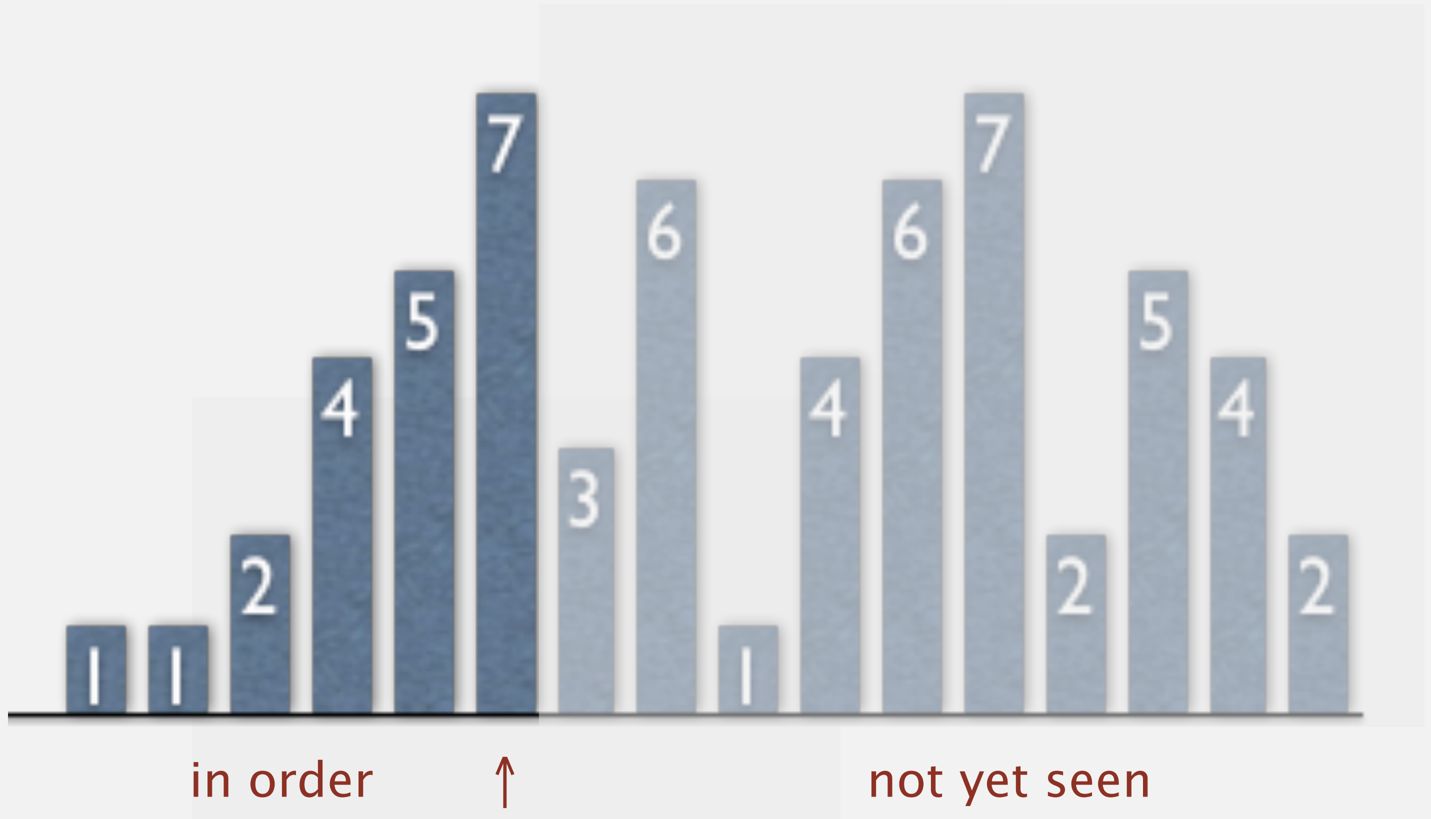
Insertion sort demo

Insertion sort

Algorithm. ↑ scans from left to right.

Invariants.

- Entries to the left of ↑ (including ↑) are in ascending order.
- Entries to the right of ↑ have not yet been seen.

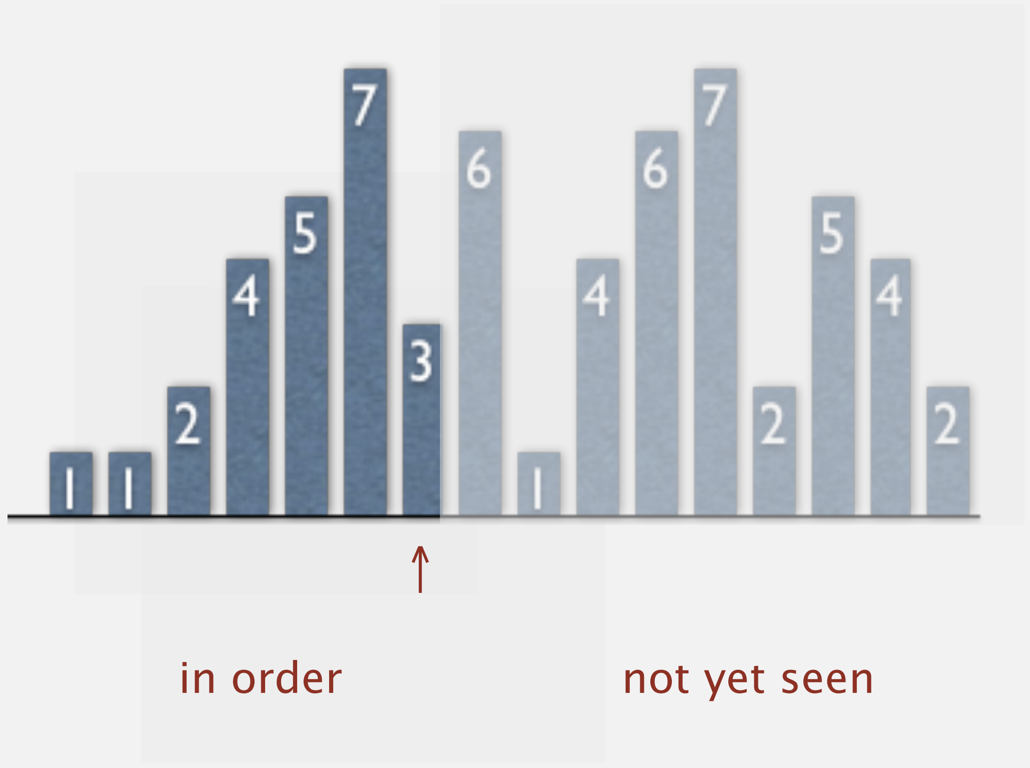


Insertion sort inner loop

To maintain algorithm invariants:

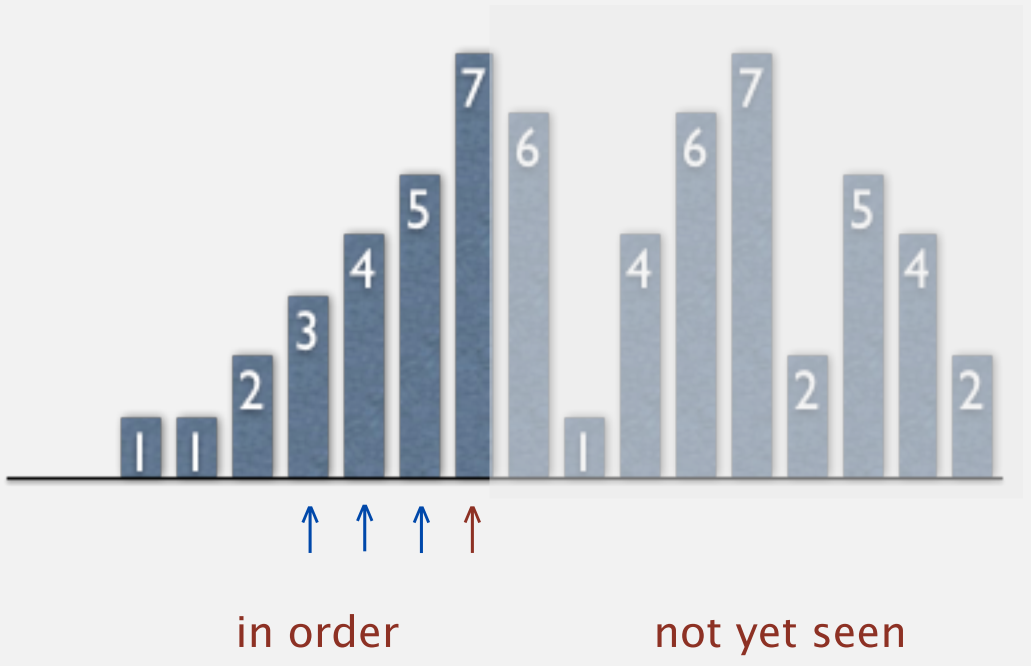
- Move the pointer to the right.

```
i++;
```



- Moving from right to left, exchange `a[i]` with each larger entry to its left.

```
for (int j = i; j > 0; j--)
   if (less(a[j], a[j-1]))
         exch(a, j, j-1);
   else break;
```



Insertion sort: mathematical analysis

Proposition. To sort a randomly-ordered array with distinct keys, insertion sort uses $\sim \frac{1}{4} N^2$ compares and $\sim \frac{1}{4} N^2$ exchanges on average.

Pf. Expect each entry to move halfway back.

Insertion sort: best and worst case

Best case. If the array is in ascending order, insertion sort makes $N - 1$ compares and 0 exchanges.

```
A E E L M O P R S T X
```

Worst case. If the array is in descending order (and no duplicates), insertion sort makes $\sim \frac{1}{2} N^2$ compares and $\sim \frac{1}{2} N^2$ exchanges.

```
X T S R P O M L E E A
```

▲ algorithm position

▬ in order

▬ not yet seen

Insertion sort: partially-sorted arrays

Def. An inversion is a pair of keys that are out of order.

```
A E E L M O T R X P S
```

```
T-R T-P T-S R-P X-P X-S
```

(6 inversions)

Def. An array is partially sorted if the number of inversions is $\le c\,N$.

- Ex 1. A subarray of size 10 appended to a sorted subarray of size N.
- Ex 2. An array of size N with only 10 entries out of place.
- Ex 3. An array where each entry is not far from its final position

Proposition. For partially-sorted arrays, insertion sort runs in linear time.

Pf. Number of exchanges equals the number of inversions.

$\uparrow$ number of compares = exchanges + (N-1)

- shuffling
- convex hull

BubbleSort

Compare adjacent elements and exchange them if they are out of order

- Moves the largest (or smallest) elements to the end of the array
- Repeating this process eventually sorts the array into ascending (or descending) order

Analysis

Worst case: O(n^2)

Best case: O(n)

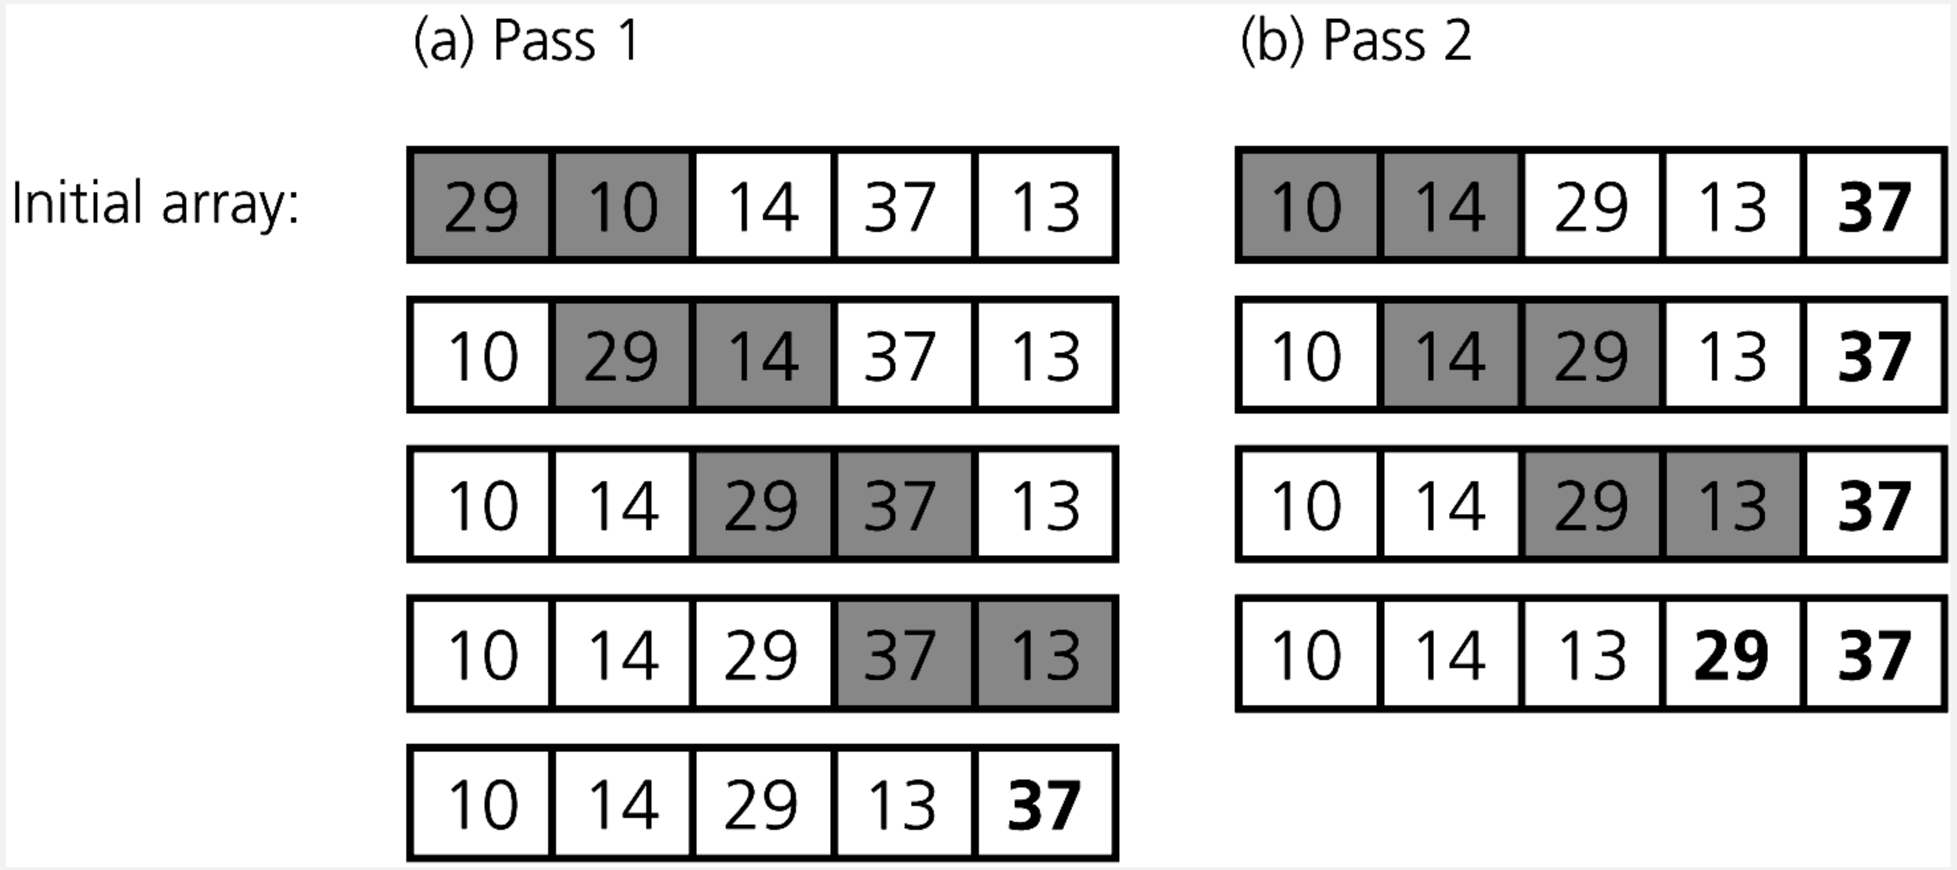

Figure: The first two passes of a bubble sort of an array of five integers: (a) pass 1; (b) pass 2
